

Abstract

In this thesis, the design of a solar energy into electrical energy absorbed by the electric car, you can use to convert the energy of nature, not to use nuclear energy generation and the like will destroy the environment. Under the sunlight during the day when there is the case of the car can be directly converted into electrical energy solar walk, or even the excess solar energy stored in the capacitor, no sun illumination at night can put the energy stored in the capacitor inside out for electric cars.
