

Abstract

Bare Filp is there in the early 19th century drawing technique, which is different from the use of eye-level perspective of the received images of different illusions sense of change graph. In this study, the MALTAB, TracePro, as well as the combined use of Unigraphics, first use MALTAB raster piece angle in radians computing and drawing pictures, and then use Unigraphics produce a configuration module, finally into the material set into TracePro simulations done on the angle of light to design a program to produce change map raster images.
